

Discover the art of body  
contouring and unlock your  
true beauty potential with  
this exceptional treatment

Experience the revolutionary power of CoolRestore Elegance, an advanced technology that precisely targets and breaks down fat cells, while ensuring the utmost care for the surrounding tissue. Through controlled cooling, this groundbreaking technique initiates lipolysis in fat cells, allowing your body to naturally process and eliminate them, resulting in a beautifully contoured appearance.

Tailored to meet your unique requirements, the Zemits CoolRestore Elegance is a versatile device that can be used on various areas of the body.

100% Holistic  
Technology

The Coolest Way to  
Sculpt and Contour  
Your Body

## Is it right for me?

- Cooling treatments for fat reduction are not intended for significant weight loss. They are most effective for individuals who are already at or near their target weight but have specific areas of stubborn fat that are resistant to diet and exercise.
- Cooling treatments are designed to target localized areas of fat, such as love handles, belly fat, thigh fat, or upper arm fat. Good candidates have specific areas they wish to address rather than seeking overall weight loss.

## What can I expect?

Cooling treatments typically offer gradual results over time. It can take several weeks to months for the body to naturally eliminate the treated fat cells, and you may notice a visible reduction in fat in the treated area during this period.

Depending on the treatment plan and desired results, you may require multiple sessions. The number of sessions will be determined during the consultation and may vary based on factors such as the target area, the amount of fat to be reduced, and individual response to the treatment.

## Is CoolRestore Elegance safe?

The CoolRestore treatment is safe, non-invasive and effective for all skin types. There are no reported short-term or long-term side effects.

## TRANSFORMATION

## How does it work?

1. Assessment: A qualified professional will assess your suitability for the treatment and determine the target areas for fat reduction.
2. Preparation: The treatment area is marked and prepared by applying a gel.
3. Application: The cooling device, which is designed to selectively target fat cells, is placed on the treatment area.
4. Cooling Process: The cooling handpiece delivers precise and controlled cooling to the targeted fat cells. This cooling process causes the fat cells to undergo apoptosis, a natural cell death process.
5. Treatment Duration: The treatment session typically lasts around 30 to 60 minutes, depending on the target area.
6. Sensation: Initially, you may feel a cold sensation and suction pressure during the treatment. However, these discomforts typically subside as the area becomes numb due to the cold temperature.
7. Post-Treatment: After the cooling treatment, the treated area is massaged to help break down the treated fat cells and enhance the overall results.
8. Fat Elimination: Over the following weeks, the body's lymphatic system gradually eliminates the treated fat cells. The fat cells are naturally processed and eliminated from the body, resulting in a reduction of fat in the treated area.
